

Tesla Model 3 2024 Owner's Manual

Model Year: 2024 | Make: Tesla | Model: Model 3

Table of Contents

1. Battery & Charging
2. Autopilot & Full Self-Driving
3. Maintenance Schedule

Battery & Charging

The Long Range Model 3 features an 82 kWh lithium iron phosphate (LFP) battery pack.

Optimal daily charge level: 80% for longevity. Charge to 100% only before long trips.

DC Fast Charging (Supercharger V3): up to 250 kW peak. Charging speed reduces above 80% SOC to protect cells.

Battery temperature is actively managed - pre-condition the battery in cold weather before driving.

Fault: BMS_a066 - Cell imbalance detected. Schedule a service appointment via the Tesla app.

Autopilot & Full Self-Driving

Tesla Autopilot uses 8 external cameras, ultrasonic sensors, and a forward-facing radar (2023 models).

FSD Beta requires a driver attention score above 85% - repeated disengagements due to inattention will disable FSD for the session.

LANE_DEPARTURE alerts trigger when the vehicle crosses lane markings without turn signal activation.

AUTO_BRAKE engages when forward collision risk exceeds the configured sensitivity threshold.

Note: Autopilot is a driver assistance system. The driver must remain alert and in control at all times.

Maintenance Schedule

Tesla vehicles have no oil changes, no spark plugs, and no transmission fluid.

Recommended annual checks:

- Brake fluid: Test for moisture content every 2 years.
- Cabin air filter: Replace every 2 years (HEPA filter every 3 years).
- Tire rotation: Every 6,250 miles.
- AC desiccant bag: Replace every 6 years.

The 12V lithium-ion auxiliary battery requires replacement approximately every 4 years.
